

Natural Language Processing

Project 2.6: English-Dutch Machine Translation

Organization

- Please read the project description carefully. All the details are presented in this document.
- Submit your solution no later than July 31st, 23:55. Submit your solution using the corresponding ISIS section, where you downloaded this document.
- You can make unlimited re-submissions until the deadline, but the latest received submission will be graded only.
- Submit your solution as a zip file with the following name format: 'NLP_project2_6_[Your Names separated by underscores].zip' containing your codes and report files.
- For those who decided to work on the project in a group, one submission of the solution would be enough.
- For each task, you see a percent that show the task's score in the whole project.
- Please use Python 3 for coding.
 - You are free to use any module/library for different tasks.
- Please put comments on your code, wherever you think it would help to improve the readability and understandability of your code.
 - You can submit your codes as a .py file or Jupyter notebook
- You should submit a short report, describing your approach to solve different tasks and also provide the obtained results (e.g., the evaluation result of your models).
 - For the report please use ACM proceedings template from here (<https://www.acm.org/publications/proceedings-template>). The office word and latex templates are provided in the page.
 - The report should be between 3 to 5 pages.
- There is a bonus task at the end of the document, as the name implies it is not a mandatory task, but you can take your time and solve it to get more scores.

Plagiarism Statement

Your project, including the report and the code, will be checked against other submissions in the class. We trust you all to submit your own work only. Copying someone else's code and report and submit it with minor changes, will be treated as plagiarism.

If you have any further questions, please write to: salar.mohtaj@tu-berlin.de

Introduction:

Machine Translation (MT) or automated translation is a process when a computer software translates text from one language to another without human involvement. Today, machine translation works best in scenarios where a text needs to be conveyed in an understandable form in another language. Using deep neural networks, the performance and accuracy of machine translation models have increased significantly in recent years.

In this project, you are going to develop your machine translation model to translate English text into Dutch and vice versa.

Data:

The data for this project is based on “European Parliament Proceedings Parallel Corpus 1996-2011”. The Europarl parallel corpus is extracted from the proceedings of the European Parliament. It includes versions in 21 European languages: Romanic (French, Italian, Spanish, Portuguese, Romanian), Germanic (English, Dutch, German, Danish, Swedish), Slavik (Bulgarian, Czech, Polish, Slovak, Slovene), Finno-Ugric (Finnish, Hungarian, Estonian), Baltic (Latvian, Lithuanian), and Greek.

As it is mentioned before, in this project you will focus on English-Dutch texts.

Please download the parallel data containing English and Dutch sentences from [here](#) (or use this address if the hyperlink doesn't work: <https://www.statmt.org/europarl/v7/nl-en.tgz>). You can find more details about the data in <https://www.statmt.org/europarl/>.

Tasks:

Task 1: Data exploration (15%)

For this task you should **extract some insights** (i.e., some statistics and graphs) from the provided data. It could be the length differences between two languages and also the number of sentences in the whole corpus. Don't limit yourself to these examples and try to find more insights in the data. Please highlight some of the most important findings in your report.

Moreover, since the dataset is too large, randomly select 10% of data (**data sampling**) to train your models on in the next steps.

Hint: if you faced codec errors in reading files, the “codecs” library could be used.

Task 2: Preprocessing (10%)

In this task, first, apply **all the necessary** pre-processing steps that you think would help to better prepare your data for the next steps. You don't have to apply all the preprocessing tasks which are covered in the course. Regarding the report, you should briefly mention in your report why you decided to apply the chosen pre-processing steps (and why not the others).

Among all the pre-processing tasks, the following are recommended:

- lowercase the text
- strip empty lines and their correspondences
- remove lines with XML-Tags (starting with "<")

Task 3: Neural Machine Translation (60%)

In this task you should do the following sub-tasks. Choose two evaluation metrics and report your results using these two metrics.

- Split data into train, validation and test sets. Use 20% of data as the test set.
- Develop an **RNN based sequence to sequence model** (encoder-decoder) to translate English input into Dutch text.
 - o In your report describe your reasons for choosing the architecture that you are using for the task.
 - o Choose and tune appropriate hyperparameters, describe the tuning process (e.g., grid search, manual tuning), and justify your final selections based on validation performance.
 - o Track the impact of different embedding models (e.g., Glove, Word2Vec and ...) on the performance of your model.
 - o Interpret the results of your model in the report. Does the length of text impact the performance of the model? What characteristics of sentences led to better translation by the model?
- Change your input and target languages (Translate from Dutch to English) and train your model again
 - o Compare the results in this step with the results from the previous step where English was the input language.
- Develop a character-based model that trains to translate characters into the target language. Compare the results by this model with the achieved results from the word-based models before.

Please report all the achieved results with either model in your report document. Moreover, describe the hyper-parameters of your neural network model in the report.

Task 4: Neural Machine Translation with Attention (15%)

In this task, improve your models from the last step by using the **attention mechanism** in your model. Compare the achieved results with and without attention mechanisms in your report. Also visualize the attention weights for a sample instance and highlight it in your report.

Bonus Task: Pivot Translation (+15%)

A pivot language, sometimes also called a bridge language, is an artificial or natural language used as an intermediary language for translation between many different languages – to translate between any pair of languages A and B, one translates A to the pivot language P, then from P to B.

For this task, you should develop a neural machine translation model for translating Dutch to Swedish, using English as the pivot language. You can download the Swedish-English parallel corpus from [here](#).
